## South Australian Neonatal Medication Guidelines

# **DOPamine** 40mg/mL injection

© Department of Health, Government of South Australia. All rights reserved.

This is a high risk medication 4.

An overdose can be rapidly fatal

#### Dose and Indications

## **Circulatory Support**

#### Intravenous infusion

3 to 20micrograms/kg/min, commence at low dose and titrate based on clinical response

## **Preparation and Administration**

#### **Intravenous Infusion**

Select the strength required based on the weight of the infant in the context of any fluid restrictions. DOPamine Concentration Selection Tables can be found on the following pages of this guideline to assist prescribers to gauge which strength is best for the patient.

Dilute the appropriate volume of DOPamine injection using compatible fluid; and administer by continuous infusion. Diluted preparation is stable for 24 hours at room temperature.

The three standard concentrations to select from are:

- > DOPamine 0.8mg/mL (800micrograms/mL)
- > DOPamine 1.6mg/mL (1600micrograms/mL)
- > DOPamine 3.2mg/mL (3200micrograms/mL)

#### Formulae

To calculate infusion rate (mL/hr):

Rate (mL/hr) = 60 x dose (micrograms/kg/min) x weight (kg) Strength (micrograms/mL)

To calculate the dose (micrograms/kg/min):

Dose (micrograms/kg/min) = Rate(mL/hr) x Strength (micrograms/mL) 60 x weight (kg)

## DOPamine Concentration Selection Table for 25mL syringes

#### DOPamine 800micrograms/mL

Dilute 0.5 mL DOPamine (40mg/mL) with 24.5mL of compatible fluid (total of 25mL). The resulting solution contains 0.8mg/mL (800micrograms/mL) DOPamine.

| Rate (mL/hr) | 0.2 | 0.3 | 0.4         | 0.5 | 0.6 | 0.7 | 0.8 | 0.9 | 1  | Rate (mL/hr) |

Discard remaining solution

## Compatible Fluids

Glucose 5%, glucose 10%, glucose/sodium chloride solutions, sodium chloride 0.9%

#### **Adverse Effects**

#### Common

Ectopic beats, vomiting, tachycardia, hypotension or hypertension

### Infrequent

Abnormal ventricular conduction, bradycardia, uraemia, mydriasis, vasoconstriction, extravasation (may cause necrosis and sloughing of surrounding tissue)

#### Rare

Allergic reaction (due to sodium metabisulfite)

## Monitoring

- Observe intravenous site for inflammation, extravasation and extreme vasoconstriction (tracking)
- Monitor closely for changes in blood pressure.

## **Practice Points**

- Correct hypovolaemia prior to administration
- Adjust the rate of infusion every 30 minutes to desired response. Titrate to discontinue
- Doses >10micrograms/kg/min can cause an increase in systemic resistance, fall in gastrointestinal blood flow and reduction in cardiac output especially in the first week of life
- > DOPamine is incompatible with alkaline solutions such as sodium bicarbonate
- > Phenytoin when given together with DOPamine may cause severe hypotension

NeoMed@health.sa.gov.au

- > Do not bolus other drugs via DOPamine infusion
- > Caution when changing IV line, avoid bolus or prolonged interruption of drug infusion
- Use cautiously in patients with heart disease, or persistent pulmonary hypertension or hepatic impairment
- > Contraindicated in ventricular fibrillation or other uncorrected tachyarrhythmias.
